Lab 3: Behavior-Based Control Using Fuzzy Rules

Out: Thursday, 27 February 2003
Due: Wednesday, 5 March 2003 by 3:00pm

Overview: In this lab, you will use fuzzy rules to combine behaviors. First, you’ll be introduced to fuzzy logic in Pyro, then you’ll look at BBWander.py to see how fuzzy rules are used. Then you will write behavior based wall following code (you can either modify your code from Lab 2 or you can start from scratch).

Part I: Investigating Fuzzy Rules and BBWander.py

To start, read the attached handout on fuzzy logic. Fuzzy rules will allow us to combine behaviors based upon a statement’s degree of truth. For example, if you are checking if the robot is close to the wall, the fuzzy value will be larger when the robot is close to the wall and smaller when the robot is far from the wall.

Now load the BBWander.py program (the code is also attached to this lab). Notice that the code for a behavior based brain is different than the code for a direct control brain. You’ll write classes of Behaviors and States (notice that you’re importing from pyro.brain.behaviors – a good thing to do is to look at the code in this file to see the internals).

The combination using the fuzzy rules can be found in the update method of the Avoid class. There are 4 fuzzy rules. Write up an explanation of how these rules are working to hand in with your lab.

While running BBWander.py in simulation, select brain from the view menu. You will be able to watch the fuzzy rules and how much each contributes to the overall behavior of the robot.

Part II: Writing Behavior Based Code Using Fuzzy Rules

In Lab 2, you wrote a direct control brain that could follow walls on the left and the right. Now you will write a behavior based brain to follow walls. Break your wall following code into rules for following on a side and staying safe in front. You should also be able to relocate a lost wall, as most of you did with flags in Lab 2.

Does the behavior of your behavior based wall follower differ significantly from your direct control wall follower? Explain your answer.
**What to turn in:** For this lab, you need to turn in your written explanations of the fuzzy rules in BBWander, your commented code for the behavior based wall follower, and a discussion of the differences between your direct control wall follower and your behavior based wall follower. You also need to show me your system working, either in office hours on Tuesday, 4 March (12:45 – 2:00) or Wednesday, 5 March (1:00 – 3:00). There will be a sign up sheet on the white board for 10 minute slots for those days. If you do not complete your demo in your slot, we will move to the next person at their scheduled time. If any slots remain at that point, you can sign up for a later one. I’d recommend testing your robot well ahead of the demo slots.
